Sector diversification of the Market Index Uniflex

How it works

On the settlement date, a starting level will be determined for each Canadian share included in the portfolio.

On the maturity date, a ratio of the closing level over the starting level for each share will be computed.

The 8 best performing shares during the 6-year term will be automatically assigned a fixed return of 60%, regardless of whether the actual return was positive or negative. The remaining 12 shares will be assigned their actual return. The global return (maximum 60%) will be calculated by averaging these 20 returns.

The value at maturity will be the highest value between:

- ▶ the initial deposit; or
- ▶ the initial deposit **PLUS** global return (maximum 60%)
